
JoomlaCloner 1.8.2 launched

Posted by Ovidiu - 2006/11/11 18:23

We launched JoomlaCloner version 1.8.2 which contains several changes to the restore process!

First, you now have the option to restore the backup in 3 ways:

- restore the full backup with files and database
- restore only the database
- restore only the files

We also added some improvements in the database import area, so now the restore process has become a 3 step process:

1. configuration on the Joomla.Cloner.php
2. restore step1 - files and configuration
3. restore step2 - database

Also we added another option for the files restore, so now if you support `shell_exec` function in php and also unzip or tar server utilities, you can restore the clones using them for a faster process! As a note, this option is in a Beta phase!

Hopefully you will find these adjustments helpful in some problems!

Best Regards!

The Development team.
