
JoomlaCloner 1.9.0 launched

Posted by Ovidiu - 2007/01/28 16:01

We are pleased to announce that JoomlaCloner 1.9.0 is out!

Some of the new features of JoomlaCloner are:

- added cron log possibility, so each time a cron will be run and you have set a log email address, you will get all the process output in your email address
- added the possibility to run multiple crons based on different configuration files, so for example you can create 2 configuration files in JoomlaCloner Config->Cron tab, one could be for full system backup and the other for only the database which could run more often
- added the possibility to restore multiple database backups, if they exist in the administrator/backups directory, this will only work inside the Joomla.Cloner.php screen
- added a new tab in JoomlaCloner Configuration called "Info", that will display the main System Info variables, like safe_mode, open_basedir, time and memory limits and also the zip/tar and mysqldump server paths if they can be determined
- added a new option called compatibility for the database backup, this will help users who will create backups and restore them on different mysql server versions

Best regards!

As an update, we have added a new feature that will try and automatically configure JoomlaCloner for the first time depending on the users server settings! It will try to determine the server paths for zip/tar and mysqldump utilities and if it fails, it will uncheck the 'Active' checkboxes so that backup will get created by using the php internal functions!

Also, added a fix for the generating a backup exclusion system, so now by excluding directories/files the backup will recurse through the system much faster!

Best Regards! JoomlaPlug.com Development Team
