## XCloner 2.0 Beta

Posted by Ovidiu - 2007/10/06 10:34

---

JoomlaPlug.com in proud to announce the launch of a new software called XCloner, backup and restore solution for any PHP/Mysql site

XCloner is the development continuation of the JoomlaCloner Joomla component, however it adds up some major changes, you may read the full post here

[http://www.joomlaplug.com/Documentation/XCloner\\_Documentation/XCloner\\_2.0\\_Beta.html](http://www.joomlaplug.com/Documentation/XCloner_Documentation/XCloner_2.0_Beta.html)

What XCloner can do now:

1. install natively on upcoming Joomla 1.5 system
2. run independently from Joomla, giving the user to ability to backup also non-Joomla system
3. you can now choose your Backup Start Path from where the file structure to be archived will be pulled

Existing client will find the software for Download in their Downloads area

Please note that the software is in Beta state, so any bug reports or suggestions are welcomed!

Best Regards!

The JoomlaPlug.com Development Team

Is this Alpha or Beta ?? The link says Beta, but the kit says Beta ? Could you please fix the references to it?

Also, please create a main menu to jump to the documentation, i.e., installation manuals, etc.

Thank you.

Richard

I'm interested in your product (XCloner), can you tell me if it's possible to clone a j1.5 site and then upload it to a sub-domain? And if so are there any special step out of the ordinary that are required? Most of the clones that I will be making will be restored/cloned to sub-domains, does anyone have any thoughts as to how well and easy this product will work for that?

Thanks for your time,  
Greg

Hi there! XCloner works mostly the same as JoomlaCloner, you can simply create a backup your original site and then with the provided restore script you can move that backup archive and restore it anywhere you like it, including site subdomains

Let me know if you have further questions! Ovidiu

Is there a trial for this? I'd like to test drive it.

Greg
