
JoomlaCloner and JCron for automated backups!

Posted by Ovidiu - 2007/11/22 00:36

David Attard from Dart Creations has written a great article on how to setup JoomlaCloner with JCron Scheduler for automated backups, you may check it here

<http://www.dart-creations.com/joomla/joomla-tutorials/automated-joomla-website-backup.html>

We are hoping to release a new version after the holidays, so most probably during the next month of January! We are also waiting for the release of Joomla 1.5 stable to see if there will be any major changes!

JCron is currently working in legacy mode with Joomla 1.5 , the native version is still under development!

Help, im getting this message when clicking on the enable cron run

Could not open /home/sites/mysite.com/public_html/bookings/templates/rhuk_milkyway/index.php for writing, please add this code manually:

using 1.5 with 1.0 legacy

You need to make this file bookings/templates/rhuk_milkyway/index.php writeable, 777 permissions

I just upgraded to the latest version of Xcloner (2.1 I believe). Prior to the upgrade, my cron job would run properly (I have a folder excluded and it did that). Now, it is not excluding this folder.

I have wasted an entire day on this, trying to get the JCron component to do what it's supposed to do and NO success. I'm very frustrated. Up until now, this has been the best money I have spent on ANY Joomla component, and I don't see that changing, but this is very disturbing.

permissions are set on my template file to 777. As far as I can tell, the component SAYS it is writing a string to the template, but I can't see where it is written.

Any help would be greatly appreciated.

Hi there! Please open a support ticket and send us your Joomla and XCloner admin details to check the cron process, what folder are you trying to exclude exactly?

As for JCron, in order for it to work properly, you would need to have frontend activity on your site, and the cron command needs to be also correct, what cron command are you using?
