
Files do not unzip on host

Posted by maplerush - 2008/02/22 02:16

I've been trying to install Joomla using Joomla start. I've got Joomla.start.php, ver.txt and Joomla_1.5.1-Stable-Full_Package.zip uploaded to the html folder on web server.

If I use the ftp option in Joomla start I get a message that reads as below:
FTP connection has failed! Attempted to connect to xx.xxx.xxx.xx for user userwebxxxxx

If I use the install files directly option, it tells me that Joomla has been installed. But it hasn't, because the installation does not open and I can see that the zip file has not been unpacked on the webserver.

Can you help?

Do you have open_basedir(PHP ini variable) set to No value on your current host? That could be one of the issues you could have, and also make sure the directory you are trying to restore it too is also fully writeable (if you are on an IIS server)

Salut Ovidiu. I am using your script Joomla.Start.php for my own repackaged customized Joomla. The script runs and transfers the zipped package but is unable to unzip. Most likely it has to do with how I am repackaging Joomla. I tried my best to make sure I am not changing the structure of the folders, but still unable to resolve it. I wanted to ask for your suggestion, on how to package it properly in order for the script to be able to unzip it.

Multumesc de ajutor
Radu
