
SQL Fehler

Posted by 1001musik - 2008/05/26 17:12

Backup functions, if I rewind sql the data base come error message all the same which attitude I use it come always an error. phpmyadmin always stops with line 69.

Fehler
Möglicherweise haben Sie einen Bug im SQL-Parser entdeckt. Bitte überprüfen Sie Ihre Abfrage genauestens, insbesondere auf falsch gesetzte oder nicht geschlossene Anführungszeichen. Eine weitere Ursache könnte darin liegen, dass Sie versuchen eine Datei mit binären Daten, welche nicht von Anführungszeichen eingeschlossen sind, hochzuladen. Sie können alternativ versuchen Ihre Abfrage über das MySQL-Kommandozeileninterface zu senden. Die MySQL-Fehlerausgabe, falls vorhanden, kann Ihnen auch bei der Fehleranalyse helfen. Falls Sie weiterhin Probleme haben sollten oder der Parser dort versagt, wo die Kommandozeile erfolgreich ist, so reduzieren Sie bitte Ihre Abfrage auf den Befehl, welcher die Probleme verursacht, und senden Sie uns einen Fehlerbericht mit den Datenausschnitt, den Sie weiter unten auf dieser Seite finden.:

From what i understand, the error seems to be related to fact that your database table jos_menu_types already has records in it, what exactly are you trying to import?

Hi there,

please let me participate in this discussion as 1001musik got the XCloner recommendation from my blog, Joomla Blog Insider. I'm using JoomlaCloner on many sites without any problems - after "admin" helped me out on my first joomlacloner setup experiences :)

facts:

- the user wants to backup a joomla database
- using phpmyadmin he has no problems in backing up & restoring the database sql file
- using XCloner he can do a database backup but he can't restore this backup using phpmyadmin
- he told me that his database is fresh and totally empty before importing the sql file
- he's using a german charset, XCloner 2.01 and Joomla 1.5.3

So his simple aim is to backup and restore the database using XCloner.

Re:SQL Fehler

Posted by admin - 2008/05/26 18:48

Hi there! The backup created through XCloner are not meant to be restored through phpmyadmin, he will need to use the XCloner restore script to make the import!

Re:SQL Fehler

Posted by Joomla Blog - 2008/05/26 18:56

Ok, that's what I thought :) So he should use the XCloner restore script I guess.

What's the fastest way to only restore the database?

Btw: As some XCloner beginners always have problems in understanding the way XCloner should be used I'll write a german step-by-step tutorial for the main XCloner functions...

Greetings & tnx for you fast feedback!

To restore only the database, he will need to first create a database only backup, upload that archive along with the backup script to the new location, and start from there the restore process

Let me know if you run into anymore issues! Ovidiu

Ok thanks :) I'm running in the issue of a quite disturbing new XCloner user... But that's another story. Now he's upset about the fact that one cannot use phpmyadmin to restore a Xcloner backup...

Usually phpmyadmin can be used to restore a database backup, is there any chance you could email us the database backup to see how it was generated and try to make an import here? maybe we could help figuring that error!

Re:SQL Fehler

Posted by admin - 2008/05/26 20:08

Found a fix for the phpmyadmin error, on the phpmyadmin Import screen there is an option called "Character set of the file: ", that needs to be set to latin1 as value in order for the database to import correctly

Tnx so much for this charset hint! I told him that and translated it into German. I'll give you feedback on this soon!

btw: have you checked your mail admin@joomlaplug.com concerning my translation proposal?
