
Copy Content from Staging sserver to Production

Posted by kichu - 2008/08/06 09:23

Hi All,
I am using Joomla for my organization site. We have two servers (Staging and Production) with the same site hosted. It is in the staging server where we create new contents or make changes to the existing content. The changed / created content will go to the online server only after approval of the authorities.
Can somebody advise me if I can use Joomla Cloner for listing the recently changed content and enable one to select the approved contents and copy those contents to the online server in a mouse click.

Thanks in Advance

Hi there! Unfortunately no, JoomlaCloner can only backup and restore full tables and not only just changed content!

Would you consider updating the product to make that happen. I.e. to allow someone to migrate only approved/changed content from a staging server to a production server? How much would you charge us to make that happen.

That would be another work horse, but if you are interested, we can provide you with some custom development, please contact us through out support system to discuss the details further with our team

Hello! We are currently experiencing a similar problem. I wonder if the situation has changed ever since? Is the promised JoomlaCloner update allowing to transfer only the content which has been changed available now?
