
Installation in the non current directory

Posted by 2181 - 2008/08/31 14:58

Joomla is set in a separate directory (www.xxx.com/joomla).
!omponet Roundcube for Joomla set in to the subdirectory of Joomla.

Configuration in main.inc.php:
components/com_roundcube/skins/default/
components/com_roundcube/temp/
components/com_roundcube/logs/

Problem:
The files of template are not connected.

Help me pls.

Hi there! The paths are correct as they point to a relative location, however i am presuming you have a template display issue? If so, try and apply 755 permissions upon the components/com_roundcube directory and all the files inside it and see if it helps

As a note, you should use the non sef url to access the component, example
http://mysite.com/Joomla/index.php?option=com_roundcube

Hope it helps! Ovidiu

You can use that link as it is by registering it in the menu as external link, the sef won't be processed this way on that area
