
Warning: ftp_put - failed to open stream: Invalid

Posted by scorptech - 2008/12/24 16:29

Hi,

I'm new to Joomla and thought I would try your Joomla start tool. Please see the attached file regarding the error I'm getting. I'm running Joomla on a Windows platform on my ISP's system. I've also tried the desktop installer and although it said that it copied the files over, when I went to view the directory via FTP login, it showed no files although when I went to delete the directory it said that it was deleting files?? I had logged out out and logged back in to make sure that I wasn't looking at a cached view of the directory.

Any idea's???

I would advise rechecking on your ftp transfer path and make sure that is correct, have you tried checking the "Install files directly" option from the Joomla.Start.php installatiohn screen?

Hi,

I've settled on using the desktop installer as this seems to work fine. The only thing that happens is when the install is complete and the "encode plugin"??? wants to run but can't.

This is not a problem although it would be nice to be able to delete installations that the system thinks are not installed but are. These show up on the intro screen where you can select "new install" or "finish install". There's no option that I can see to delete these "partial installs".

Otherwise, great product!!! Saves sooo much time!!!
