
500 Internal Server Error

Posted by waynehs - 2009/03/07 03:03

I get "500 Internal Server Error" on my website after completing the restore process...

Background:

I had my website running on my laptop using XAMPP. I installed JoomlaCloner, backedup and ran the Joomla.Cloner.php tool to unpack and restore the website to it's new location.

I recieved no error messages during the process, permissions seem all ok and the database populated with the final message "All should be done! Click here to continue..."

Yet, I still get the above error message?

Any suggestions appreciated.

Thanks,
Wayne

To fix the 500 error , the best way would be to check your server error log!

Most probably the issue you have is related to a permission issue, so to fix it apply 755 permissions on these files:

1. index.php
2. administrator/index.php and administrator/index2.php

Regards, Ovidiu

Thanks. I fixed those permissions but now I get "Database Error: Unable to connect to the database:Could not connect to MySQL"

Any ideas on this?

Additionally, I am not sure how to check my server error log?

Thanks again
Wayne

Re-run the restore process but this time check the "skip files restore" option

As for the server error logs, contact your hosting support to find out where they are located

Ovidiu

Thanks heaps Ovidiu, you were correct.

I ran Joomla.Cloner.php again with those options and it worked. I now have a website.

PS. Your response time to my requests for assistance have been outstanding. A true credit! Even for me here on a Saturday night too!

Cheers,
Wayne

Wait...

I just realised that url/administrator does not work... Internal Server Error again?
Any ideas?

Thanks again,
Wayne

File does not exist: /home/irymp0/public_html/500.shtml
Premature end of script headers: /home/irymp0/public_html/administrator/index.php
SoftException in Application.cpp:544: Directory "/home/irymp0/public_html/administrator" is writeable by group

Does this help you?

Re:500 Internal Server Error

This error message "administrator" is writeable by group means you should apply 755 permissions on the administrator/ directory, all should work afterwards

Ovidiu

I had the same errors in my log except for the administrator writability issue. I was pretty sure that user permissions was not an issue.

It turns out (according to my hosting provider) that my server (a shared server) has a 5 minute timeout when PHP is in Fast CGI mode. I had to disable Fast CGI temporarily while I ran the XCloner.php script (easy to do from my hosting provider's control panel). It worked fine then, and after I was done I put PHP back in Fast CGI mode.

I have the same error, though my PHP settings in Fast CGI mode are by default. What kinda error can it be?
