
Cloned site not working fully.

Posted by lownotes - 2009/12/28 20:25

I'm using Xcloner 2.1.0 to move a J1.5.14 based site to a new server.

The new server is setup running SUSE linux and LAMP with latest modules. We used Xcloner and did a manual restore on the new server.

The website restored correctly, however it shortly became unaccessable with a blank home page. Can still log in and can also access internal pages, just not the home page. I have full access to the admin side as well.

I've eliminated almost all modules on the home page and also tried changing the template. Still can't get to the home page.

The problem is elusive.

I have all caching turned off. I have max error reporting turned on.

I don't see anything new in the error log files either.

It seems like a permissions/owner or cache issue but I not an expert there.

Any help would be very appreciated.

Thank you

Pretty sure I solved it.

Looks like a conflict with one of my modules. RokWeather!!!
